## # 5 R2007 DWG FILE FORMAT ORGANIZATION

### ## 5.1 Sections and pages overview

**-Like the R18 format the R21 format has sections and pages. There are system sections and data sections.**

**+Like the R18/R2004 format the R21/R2007 format has sections and pages. There are system sections and data sections.**

The system sections contain information about where the data sections and their pages are in the stream.

A system section only has a single page, while a data section can have multiple pages. The page map contains information about where each data page is in the file stream. The section map has information about which pages belong to which section. The file header, which is at the beginning of the file, just after the meta data, contains the stream locations of the page map and section map.

```

## ## 5.13 Reed-Solomon encoding

-R21 uses Reed-Solomon (RS) encoding to add error correction. Error correction codes are typically used in telecommunication to correct errors during transmission or on media to correct e.g. errors caused by a scratch on a CD. RS coding takes considerably study to master, and books on the subject require at least some mathematical base knowledge on academic level. For this reason it's recommended to use an existing RS implementation, rather than to build one from scratch. When choosing to learn about the subject, a good book on the subject is "Error Control Coding, Second Edition", by Shu Lin and Daniel J. Costello, Jr. This book is taught over two semesters, to give an idea of the depth of the subject. RS coding is treated in Chapter 7 out of 22, to have a full understanding of the subject chapters 1-7 should be read.

+R2007 uses Reed-Solomon (RS) encoding to add error correction. Error correction codes are typically used in telecommunication to correct errors during transmission or on media to correct e.g. errors caused by a scratch on a CD. RS coding takes considerably study to master, and books on the subject require at least some mathematical base knowledge on academic level. For this reason it's recommended to use an existing RS implementation, rather than to build one from scratch. When choosing to learn about the subject, a good book on the subject is "Error Control Coding, Second Edition", by Shu Lin and Daniel J. Costello, Jr. This book is taught over two semesters, to give an idea of the depth of the subject. RS coding is treated in Chapter 7 out of 22, to have a full understanding of the subject chapters 1-7 should be read.

An open source RS implementation is available from <http://www.eccpage.com/>, item "Reed-Solomon (RS) codes", by Simon Rockliff, 1989. This implementation uses Berlekamp-Massey for decoding. Note that there are many ways to encode and decode, the implementation above is just one example. Though only 404 lines of code, the math involved is very sophisticated.

-DWG file format version R21 uses two configurations of RS coding:

+DWG file format version R2007 uses two configurations of RS coding:

\* Data pages: use a (n, k) of (255, 251), the primitive polynomial coefficients being (1, 0, 1, 1, 1, 0, 0, 0). This configuration can correct  $(255 - 251) / 2 = 2$  error bytes per block of 255 bytes. For each 251 data bytes (k), 4 parity bytes are added to form a 255 byte (code word) block.

\* System pages: use a (n, k) of (255, 239), the primitive polynomial coefficients being (1, 0, 0, 1, 0, 1, 1, 0). This configuration can correct  $(255 - 239) / 2 = 8$  error bytes per block of 255 bytes. For each 239 data bytes (k), 16 parity bytes are added to form a 255 byte (code word) block.

This region holds the actual objects in the drawing. These can be entities, table entries, dictionary entries, and objects. This second use of objects is somewhat confusing; all items stored in the file are â\200\234objectsâ\200\235, but only some of them are object objects. Others are entities, table entries, etc. The objects in this section can appear in any order.

Not all objects present in the file are actually used. All used objects can eventually be traced back to handle references in the Header section. So the proper way to read a file is to start reading the header and then tracing all references from there until all references have been followed. Very occasionally a file contains e.g. two APPID objects with the same name, of which one is used, and the other is not. Reading both would be incorrect due to a name clash. To complicate matters more, files also exist with table records with duplicate names. This is incorrect, and the software should rename the record to be unique upon reading.

-For R18 and later the section data (right after the page header) starts with a RL value of 0x0dca (meaning unknown).

+For R2004 and later the section data (right after the page header) starts with a RL value of 0x0dca (meaning unknown).

## 20.1 Common non-entity object format

Objects (non-entities) have the following general format:

Version	Field type	DXF group	Description
-----	-----	-----	-----
	MS		Size in bytes of object, not including the CRC

| R2010+ | MC | | Size in bits of the handle stream (unsigned, 0x40 is not interpreted as sign). This includes the padding bits at the end of the handle stream (the padding bits make sure the object stream ends on a byte boundary).

- Common

+ Common

| OT | | Object type  
R2000-R2007  
| RL | | Size of object data in bits (number of bits before the handles), or the  $\text{endbit} \setminus 235$  of the pre-handles section.

Common:  
| H | 5 | Object  $\setminus 231$ s handle

@@ -3011,11 +3071,11 @@

Drawing entities, which are of course objects, have the same format as objects, with some additional standard items:

MS : Size of object, not including the CRC

R2010+:

MC : Size in bits of the handle stream (unsigned, 0x40 is not interpreted as sign).

- Common:

For objects with non-fixed values, taking the object type minus 500 gives an index into the class list, which then determines the type of object. For instance, an object type of 501 means that this object is of the class which is second in the class list; the `**classdxfname` field determines the type of the object.

See the sections on EED a description of that areas.

-In the R24 format the old table data structures were replaced with new data structures, of which the root is the AcDbTableContent class. The old data structures are still used in the DXF format. An R24 DXF file contains both the old and new structures, where the new structures are optionally used. If AutoCAD can store all data just using the old structures it does not always write the new structures in DXF. In an R24 DWG file, always the new structures are used. The table then points to a AcDbTableContent object, which contains most of the actual data. Note that AcDbTableContent was already introduced in AutoCAD 2008 (R21), but in R21 it was indirectly referenced through the tables extension dictionary entry 'ACAD\_XREC\_ROUNDTRIP' (TODO: describe details on 'ACAD\_ROUNDTRIP\_2008\_TABLE\_ENTITY' and for 2007).

### ### 20.4.97 TABLECONTENT

-This represents the table content (AcDbTableContent) that replaces the old table data structures that were introduced in AutoCAD 2005. Table content was introduced in AutoCAD 2008 and supports more advanced features like e.g. multiple contents per cell. In AutoCAD 2008 the table content was written as a separate object in DWG and referenced by roundtrip data in the table entity's extension dictionary. In DXF this is still the case even for R24. In a R24 DWG file, the table content is part of the table entity data and is no longer present as a separate object. Possibly for backwards compatibility with the AutoCAD 2007 (R21) format, this separate data container was created instead of extending the ACAD\\_TABLE entity.

+This represents the table content (AcDbTableContent) that replaces the old table data structures that were introduced in AutoCAD 2005. Possibly for backwards compatibility with the AutoCAD 2007 format, this separate data container was created instead of extending the ACAD\\_TABLE entity.

The table content class inherits from 3 other classes, which never exist independently so they will all be described in this paragraph. AcDbTableContent inherits from AcDbFormattedTableData, which inherits from AcDbLinkedTableData, which inherits from AcDbLinkedData. Class AcDbLinkedTableData contains most of the data (rows, columns, cells, cell contents).

# 21 Data section AcDb:ObjFreeSpace

```

-The meaning of this section is not completely known. The ODA knows how to write a valid section, but

- the meaning is not known of every field.

+From R13 to R2000 this section is the third section, which is immediately followed by the SECOND FILE HEADER (R13-R2000). See chapter 26.

-## 21.1 Until R18

```
+### 21.1 Until R2007
```

Type	Length	Description
Int32	4	0
UInt32	4	Approximate number of objects in the drawing (number of handles).
Julian datetime	8	If version > R14 then system variable TDUPDATE otherwise TDUUPDATE.
UInt32	4	Offset of the objects section in the stream.
UInt8	1	Number of 64-bit values that follow (ODA writes 4).
UInt32	4	ODA writes 0x00000032.
UInt32	4	ODA writes 0x00000000.
UInt32	4	ODA writes 0x00000064.
UInt32	4	ODA writes 0x00000000.

# 23 Data section AcDb:Handles (OBJECT MAP)

### 23.1 R13-15  
### 23.1 R13-2000

The Object Map is a table which gives the location of each object in the file This table is broken into sections. It is basically a list of handle/file loc pairs, and goes (something like) this:

```
```\nSet the "last handle" to all 0 and the "last loc" to 0L;\n@@ -9177,13 +10008,13 @@\nEnd top repeat\n```\n
```

Note that each section is cut off at a maximum length of 2032.

### 23.2 R18  
### 23.2 R2004

-This section is compressed and contains the standard 32 byte section header. The decompressed data in this section is identical to the â\200\234Object Mapâ\200\235 section data found in R15 and earlier files, excepts that offsets are not absolute file addresses, but are instead offsets into the AcDb:Objects logical section (starting with offset 0 at the beginning of this logical section).

```
-# 25 UNKNOWN SECTION
```

```
+# 26 SECOND FILE HEADER (R13-R2000)
```

-This section is largely unknown. The total size of this section is 53. We simply patch in "known to be valid" data. We first write a 0L, then the number of entries in the objmap +3, as a long. Then 45 bytes of "known to be valid data". Then we poke in the start address for objects at offset 16.

+This is directly after the ObjFreeSpace section. See chapter 21.

-The 45 bytes of known to be valid data are:

```
-
-    0xA7,0x62,0x25,0x00,0xF6,0xAF,0x25,0x02,
